When foliar spraying, buffer zones shall be observed in appropriate instances to avoid non-target damage caused by drift, volatility or other unplanned herbicide movement, except that spraying may be performed near water using herbicides specifically labeled for use in aquatic areas. Where laws, regulations, product label, etc., define the presence and extent of buffer zones, these definitions must be followed to the extent stipulated. **The distances below are benchmarks set forth by NU and may be decreased where specific laws, regulations and product label stipulate.** It will be at the discretion of the applicator, not to exceed product labels, with the agreement of Newport Utilities to encroach on the set buffer distances where no damage to customer’s private property or the utility will be encountered. The buffers set for ponds, streams, etc., can be encroached by the contractor as long as no direct or indirect damages to the body of water will be encountered. Buffers for crops can be encroached unless the crops are certified organic or are extremely sensitive to herbicides such as tobacco. Any ambiguity will be clarified by the contractor and Newport Utilities representative. The only buffer not to be encroached will be the buffer pertaining to apiaries and active bee hives.

<i>Item Description</i>	<i>Buffer Zone Distance</i>
House	100 Feet
Lakes, ponds, rivers, streams	50 Feet
Barns	100 Feet
Gardens (Vegetable & Flower)	100 Feet
Farm Crops	100 Feet
Tobacco	200 Feet
Grape Arbors	100 Feet
Apiary (Bee Hives)	100 Feet
